Logic Apps is a subset of Autodesk's cloud-based platform for building applications that can be triggered by events. It has features such as location-based workflows and response to messages, such as a set of workflows that can be used by a group of users to fix problems. Logic Apps is available on the web or on-premises, and it can be accessed from mobile

devices. Other features of Autodesk's cloud platform include software as a service (SaaS) such as AutoCAD 360 and Hoot to help with building and managing websites. For hardware, there is a set of desktop and mobile devices running Autodesk's software. A drawing is created using AutoCAD on the computer screen, and this image can be sent to a printer. Then it can be scanned by a scanner or photographed by a digital camera. Both the desktop and

mobile applications run as stand-alone programs and offer their own separate menus and command-line processes. Main Menu The main menu of the application has options for:

Import from: Printed paper. A PDF of the paper that should be used to print your final product can be exported from your print shop, or you can open the PDF in your default PDF-reader application. The former option is easy; the latter takes just a second. Use the existing clip markers, text-tables, diagrams, and other parts of the imported PDF. Feedback from: Printed paper. Existing markers, text-tables, and diagrams can be brought into your drawing in a few clicks. Add in your own

content in the text or header area of the clip marker. Add your own content or change the fonts of the imported clip marker. Import from the “custom” dialog will open the user-defined clip marker in a new drawing window.

Automatic clip markers: Use the existing clip markers in your drawing by dragging them into your document. They will become auto-inserted at the current insertion point. By default, the text, line, and polyline clip markers are always

visible in your drawing.

Metadata: You can now export file properties as metadata, such as drawing date, scale, resolution, etc. Metadata information is stored in the metadata tags. Metadata is useful for sending files to other software and apps.

New composite tools: With the new composite tools (SMART_COMPOSITE), you can create custom tools to make common tasks easy to do. For example, you can create a tool that will create a composite of

the object's boundary to its immediate left or right. See the video to learn more. QR Code Scanning: You can now use the new QR Code Scanner to quickly add QR Codes to your drawings. (QR codes are two-dimensional barcodes that store data). See the video to learn more. Text styles: You can now apply text styles to collections of text in your drawing. Apply text styles to a selected text in a text table, label, or text block. Or you can apply the same text style to all text in the document.

See the video to learn more.

Snap: You can now snap your drawing to a reference such as a construction line. Use the **INSTEAD** or **RESTORE** commands to switch back to the snapped view if you need to adjust your drawing. Magnetic:
